

Our main objective at Microviable Therapeutics is to develop products based on intestinal microbiota, mainly with therapeutic or co-adjuvant purposes, to restore the intestinal dysbiosis associated with several diseases. Examples of these are antibiotic-associated diarrhea or inflammatory bowel diseases.

Microviable Therapeutics is a company integrated by a multidisciplinary team of researchers with expertise in intestinal microbiota and human health, as well as experts in marketing, business and administration. In addition, we have a network of collaborators in different hospitals, universities and research centers, both at national and international level. Our head-office is located in Asturias (northern Spain).

We are developing different products, based on viable and well-characterised gut microbiota, focused on the restoration of the intestinal ecosystem after disrupting treatments, such as prolonged antibiotic intake or pelvic radiotherapy. We are also developing biotherapeutics for the treatment in which an altered microbiota is detected.

Taking care of your  
intestinal microbiota

# Isolation and preservation of human intestinal microbiota for microbial restoration therapies

Start-up from the “Spanish National Research Council”, CSIC, founded by senior scientists with extensive experience in microbiology, probiotics, and human microbiota; complemented with a business development team in healthcare.

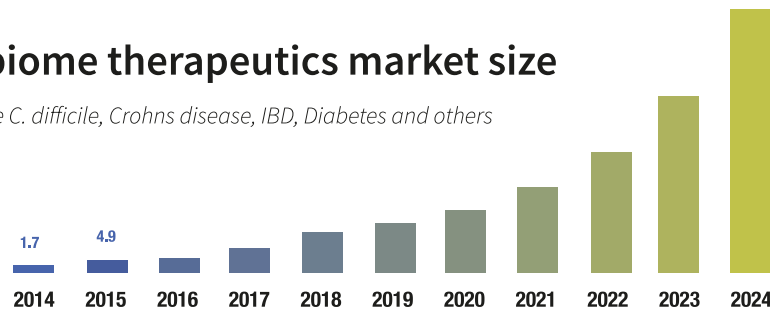

## The problem

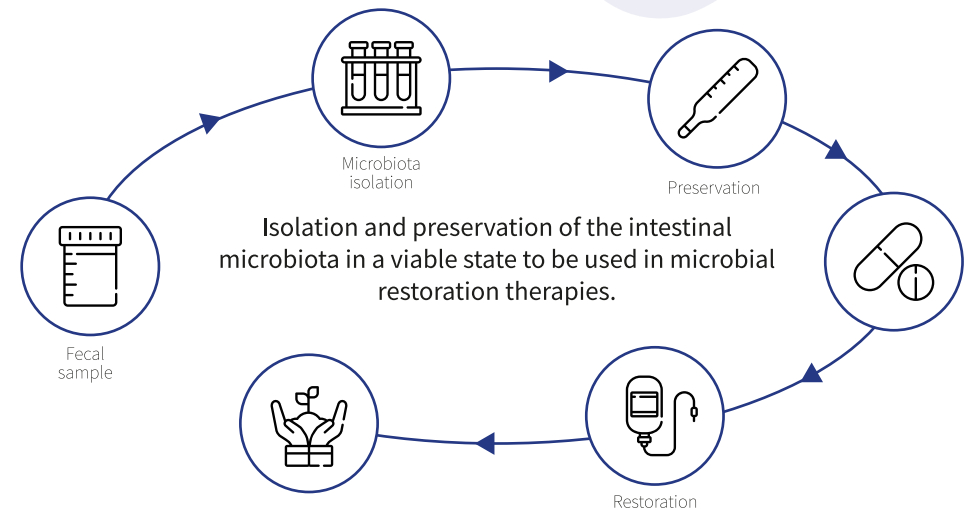

## Microbiome therapeutics market size

Data include *C. difficile*, Crohns disease, IBD, Diabetes and others

## The solution

“Healthy intestinal microbiotas as a therapeutic product”

Technology developed to standardize protocols, improve faecal microbiota transplantation and generate new therapeutic products.

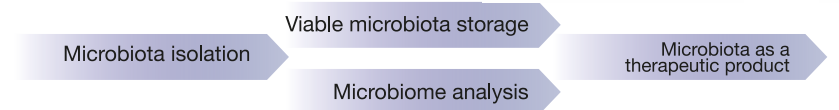

## Products and Services

Stool collection in anaerobic conditions  
Bacterial viability after 72h  
Unique on the market  
Standardized protocols
